Hi Hiring Team,

I came across your opening for a Senior AI/ML Engineer, and it immediately stood out — it sounds like the kind of work where AI isn't just a feature, but a core part of the product.

Over the past 10+ years, I've been building end-to-end AI systems that move beyond prototypes into production — systems that handle real users, real scale, and real-world messiness. Most recently, I designed and delivered a voice-driven AI concierge platform for the hospitality industry, combining LLMs, RAG pipelines, and predictive models to automate guest interactions and service workflows at scale. The system processes thousands of concurrent interactions, integrates with multiple backend systems, and delivers real-time, context-aware responses.

A big part of my work has been making AI systems actually usable and reliable in production. That means building not just models, but the full ecosystem around them — data pipelines, retrieval layers, microservices, and cloud infrastructure. I've worked extensively with Python, PyTorch, Transformers, LangChain, and vector databases like Pinecone and FAISS, along with AWS, Azure, and GCP to deploy and scale systems globally.

What I enjoy most is working across the full stack of AI development — from shaping the problem and designing the architecture to optimizing performance and ensuring the system holds up under real-world conditions. I tend to gravitate toward problems where there's complexity, ambiguity, and a need to balance speed with long-term scalability.

I'm particularly interested in roles where AI is treated as a product capability, not just an experiment — where the focus is on building systems that are intelligent, dependable, and genuinely useful.

If that aligns with what you're building, I'd be glad to connect and talk through how I could contribute.

Best regards,

Alari Ilves
