Hi Hiring Team,

I came across your role for a Senior Full-Stack Engineer, and it caught my attention — especially the focus on building scalable, production-ready systems rather than just shipping features.

Over the past 10+ years, I've been working across the full stack — from frontend performance and mobile apps to backend services and cloud infrastructure — with a strong focus on systems that need to scale and stay reliable under real-world usage. Most recently, I led the migration of a large-scale medical platform (100K+ pages) to a composable architecture using Next.js, Node.js, and modern cloud infrastructure, improving performance, maintainability, and deployment flexibility across regions.

A big part of my work has been designing systems that handle complexity well — event-driven architectures with Kafka and RabbitMQ, search platforms with Elasticsearch and Algolia, and distributed caching with Redis to keep things fast under load. I've also built cross-platform mobile apps with React Native and Expo, focusing on real-time features, offline support, and smooth user experience across devices.

I enjoy working at the intersection of product and engineering — not just building features, but thinking about how systems evolve, how teams scale, and how to make architecture decisions that hold up long-term. Recently, I've also been integrating AI capabilities (OpenAI, Claude) into applications to automate workflows and enhance user-facing features in a practical, production-ready way.

Tech-wise, I'm strongest with TypeScript, React, Next.js, Node.js, and cloud platforms like AWS, Azure, and GCP — but more importantly, I focus on building systems that are clean, scalable, and actually usable.

If you're looking for someone who can take ownership of complex systems and help turn them into fast, reliable products, I'd be happy to connect.

Best regards,
Karl-Gustav Peterson
