Hi Hiring Team,

I am a Senior Python Full-Stack Engineer with over 10 years of experience building scalable, production-grade systems across real-time platforms, AI-driven applications, and distributed architectures. My work focuses on delivering high-impact solutions that combine performance, reliability, and intelligent automation.

In my recent role, I led the development of a real-time AI-powered communication platform, enabling multilingual transcription and meeting intelligence at scale. By integrating modern GenAI capabilities and optimizing distributed systems, I reduced manual documentation effort by 70% while maintaining low-latency performance across concurrent users.

Previously, I built secure, AI-driven voice systems in the healthcare domain, designing microservices and asynchronous pipelines to support real-time patient interaction. This work improved engagement by 30% while ensuring compliance and reliability in sensitive environments. I have also delivered automation platforms that reduced operational workload by 75% and built data-intensive systems that improved user engagement through real-time personalization.

My technical strengths lie in Python (FastAPI, Django), distributed systems, cloud-native architecture (AWS, Kubernetes), and modern frontend frameworks. I am experienced in designing end-to-end systems, from backend services and data layers to responsive user interfaces, with a strong focus on scalability and maintainability.

I am particularly interested in roles where I can contribute to building high-performance systems and AI-enabled products that solve meaningful problems at scale. I value environments that emphasize ownership, engineering excellence, and continuous improvement.

I would welcome the opportunity to bring my experience to your team and contribute to delivering impactful, production-ready solutions.

Best regards,
Madis Altmann
