Dear **Hiring Manager**,

I'm a Senior Full Stack Software Engineer with 10+ years of experience designing and delivering cloud-native, high-availability platforms at scale. My background spans ASP.NET Core, C#, React/Next.js, TypeScript, and event-driven architectures, with a strong focus on performance, reliability, and developer experience.

In my recent role at Emergent Software, I architected a microservices-based ecommerce and content platform serving multi-region traffic across the U.S. I led the design of Azure infrastructure with geo-routing, autoscaling, Redis caching, and CDN edge optimization, scaling traffic more than 50× while maintaining zero downtime during national campaigns. On the frontend, I built modular React and Next.js applications optimized for SSR, accessibility, and SEO, replacing legacy workflows with a unified, high-performance user experience.

Previously at BairesDev, I worked on large-scale, real-time systems using Apache Kafka, Cassandra, SignalR, and containerized .NET services. I focused on low-latency data pipelines, schema-driven systems, and high-throughput event processing, enabling near-real-time analytics under millions of daily events. Earlier in my career, I delivered greenfield platforms on AWS, integrating secure authentication, real-time communication, and scalable background processing across distributed systems.

Across roles, I've consistently owned systems end-to-end—from architecture and implementation to CI/CD, infrastructure as code, observability, and production operations. I value clean system design, pragmatic trade-offs, and building platforms that scale with both user growth and organizational complexity.

I'm excited about the opportunity to contribute my experience in building resilient, scalable software to a team solving meaningful, high-impact problems. I would welcome the chance to discuss how my background aligns with your needs.

Thank you for your time and consideration.

Sincerely,

William Maddox
